                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is a trabecular meshwork induced glucocorticoid response protein (TIGR) promoter mutant, TIGRmt2, which is used in a method for diagnosing glaucoma in a patient. The method involves the detection of polymorphisms whose presence is predictive of a mutation affecting TIGR response in the patient and can be diagnostic of glaucoma or steroid sensitivity. Base substitutions and base additions upstream of and withing TIGR exons can also be used to diagnose glaucoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 5300 BP; 1482 A; 1151 C; 1235 G; 1432 T; 0 U; 0 Other;

               This sequence is a trabecular meshwork induced glucocorticoid response protein (TIGR) promoter mutant, TIGRmt5, which is used in a method for diagnosing glaucoma in a patient. The method involves the detection of polymorphisms whose presence is predictive of a mutation affecting TIGR response in the patient and can be diagnostic of glaucoma or steroid sensitivity. Base substitutions and base additions upstream of and withing TIGR exons can also be used to diagnose glaucoma
                                                                                                                                                                                                           28-JAN-1997;

The method involves the detection of polymorphisms whose presence is predictive of a mutation affecting TIGR response in the patient and can be diagnostic of glaucoma or steroid sensitivity. This sequence is a trabecular meshwork induced glucocorticoid response protein (TIGR) promoter mutant, TIGRmt3, which is used in a method for diagnosing glaucoma in a patient. The method involves the detection of polymorphisms whose presence is predictive of a mutation affecting TIGR response in the patient and can be diagnostic of glaucoma or steroid sensitivity. Base substitutions and base additions upstream of and withing TIGR exons can also be used to diagnose glaucoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mutation

The present sequence represents a sequence varaint of the TIGR CC (trabecular meshwork inducible glucocorticoid receptor) promoter. The CC specification describes a method for the diagnosis, prognosis and CC treatment of glaucoma, based on detecting specific polymorphisms in the CC promoter of the TIGR gene. The method is used for diagnosis and prognosis CC of glaucoma (of all types), steroid sensitivity and progressive ocular CC hypertension that leads to loss of vision. Glaucoma can be treated by CC administering an agent that binds to cis-acting elements within the TIGR CC promoter. The TIGR promoter (or other regulatory regions) can be used to express homologous or heterologous genes, particularly for tissue—CC express homologous or heterologous genes, particularly for tissue—CC specific expression of therapeutic transgenes for treating glaucoma, also CC control transgenic animals and in screening for compounds (specific CC modulators) with diagnostic or therapeutic potential. Fragments of the CC TIGR sequence can be used as amplification primers or probes, e.g. for isolating related sequences in non-human animals
                                                                                                                                                                                                                                                                                                                    Diagnosis, prognosis and treatment of glaucoma, based on specific polymorphisms in the promoter of the trabecular inducible glucocorticoid receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         vision

/note="Organ: Eye; Vector: pcMVSPORT6; Two different donor eyes (75-80 years old) yielded approximately 600 mg of dissected RPE/choroid tissue. This in turn yielded 340 ug of total RNA and 7 ug of mRNA. A directionally cloned cDNA library in the pcMvSPORT6 vector was constructed at Life Technologies (Rockville, MD; now part of Invitrogen Corp), essentially following the protocols of the SuperScript Plasmid System (Invitrogen Corp.). *http://www.invitrogen.com/>). The library code designation was cs. For this library, cDNA inserts were cloned into the NotI/MlI sites of the vector. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1. .654

/note="Organ: Eye; Vector: pCMVSPORT6; Two different donor eyes (75-80 years old) yielded approximately 600 mg of dissected RPE/choroid tissue. This in turn yielded 340 ug of total RNA and 7 ug of mRNA. A directionally cloned cDNA library in the pCMVSPORT6 vector was constructed at Life Technologies (Rockville, MD; now part of Invitrogen Corp), essentially following the protocols of the SuperScript Plasmid System (Invitrogen Corp.

-http://www.invitrogen.com/>). The library code designation was cs. For this library, cDNA inserts were cloned into the NotI/MuI sites of the vector. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing Center (NISC)."

Patent No. 6171788
GENERAL INFORMATION:
APPLICANT: NGUYEN, Thai D.
APPLICANT: Polansky, Jon R.
APPLICANT: Polansky, Jon R.
TITLE OF INVENTION: METHODS FOR THE DIAGNOSIS,
TITLE OF INVENTION: PROGNOSIS AND TREATMENT OF GLAUCOMA AND
TITLE OF INVENTION: RELATED DISEASES
TITLE OF SEQUENCES: 32
                                           δ
                                                                 당
                                                                                                  á
                                                                                                                               밁

Sequence 2, Application US/09306828
Patent No. 6475724
GENERAL INFORMATION:
APPLICANT: Nguyen, Thai D.
APPLICANT: Chen, Pu
APPLICANT: Chen, Hua
TITLE OF INVENTION: Nucleic Acids, Kits, And Methods For The Diagnosis, Prog
CURRENT FILING DATE: 1999-05-07
EARLIER APPLICATION NUMBER: US/09/306,828
CURRENT FILING DATE: 1999-01-11
NUMBER OF SEQ ID NOS: 38
SOFTWARE: Microsoft Word 97
SEQ ID NO 2
LENGTH: 5304
TYPE: DNA
ORGANISM: Homo sapiens
